Project Part 1

Due date
Sunday 6th April before 11:30 PM

Requirements

1. Once your project idea is approved and you determined what company you will be building the website for, you need to gather images. Your website must have a logo image and between 15-20 different images for products as each product must have its own image. In other words, you cannot use the same image for all products.

    You may download images from the Internet or create your own. Make sure the images are not distorted and have suitable dimensions to display in a web page. In addition, you may want to use icon images in your web pages for popular social media links such as Twitter, Facebook, YouTube, Instagram, etc.

    You will need to layout all your images in a word document with citation (link) for each image.

2. Your website must have a consistent and clear main navigation menu that contains links to all pages. The website must have at least four pages: *Home*, *Products*, *Contact us*, and *Subscribe* (subject to change in the future), but you can add more if you wish. You don't have to finish all pages in this deliverable, but you need these names to create the main navigation menu.

3. Create a design and determine the general layout of your web pages. Typically, a website will have the same *header*, *navigational links*, and *footer* across all pages. Be creative in this part as it will be reflected in all pages.

4. Create a template of the common parts so that you can use it whenever you create a new web page.

5. Copy the template and complete the main page of your website (the HTML file of the main page is usually named index.html). This page must also contain:

    a. An introduction about the company and its products/services.

    b. A section displaying some featured products, such as products currently on sale, or products that are most purchased. At least five sample products must be displayed as a grid with their description and images.

    c. A section containing few testimonials, quotes, or product reviews from happy customers.

    Note: The HTML tag `<blockquote></blockquote>` can be used to create a block element containing quotes. Whereas the `<q></q>` tag can be used to add an inline short quotation.

    d. You can add additional parts to this page as you find suitable.

6. Add styles to the home page to enhance its look.

Submission

Zip the whole folder containing all your website files (including HTML files, style sheets, and image files) as a *.zip* and submit it to Google Classroom.
